Option A

GUARD

Guidance for **U**ser **A**wareness, **R**easoning and **D**ependence)

System Concept

A quick reminder

An AI-powered interface that **runs on top of a chatbot / LLM** and monitors user interaction to detect over-reliance and intervenes with explanations, sources and verification prompts:

1. Tracks interaction patterns (questions, follow-ups, time-to-action)
2. Estimates a **trust score** (from healthy collaboration to **blind trust**)
3. Triggers interventions when risky patterns are detected

Initial Design of GUARD Interface (C1)

Main Screen:
Login / History

Main Chat: Trust
Rate and Sources

Interface Mockup / Prototype

Main Screen:
Login / History

Main Chat: Trust Rate
(Prompt Depth) and
Sources

Interface Mockup / Prototype

Interaction example:

The user repeatedly avoids engaging with the task independently, insisting they do not want to think about the project.

The system first **reminds** the user that it cannot directly complete work.

Then it **gently supports** the user upon noticing their reluctance to work.

On the third interaction, it **maintains guidance** while not giving in to the user's insistence.

System Architecture

Plan for Short User Study

To observe **user interactions** with GUARD, while simultaneously evaluating the system's effectiveness and accessibility.

- 20 – 40 participants
- ~ 5 minute interaction sessions
- Observe user interactions with GUARD
- Evaluate usability, accessibility, and intervention perception
- Collect qualitative and quantitative feedback
- Identify limitations and guide future iterations

Short Demo
